

## Unique Identifier Traceability Software

Today, all manufacturers who aspire to achieve or to maintain a world-class status must deliver some degree of traceability, each part or board is mark with a unique code. Unique Identifier Traceability System is a high efficiency, user-friendly system that able to trace such as MAC, EHA, SAS, UUID, WWID, etc. Using unique identifiers enables manufacturers to keep detailed production histories of each assembly and its parts, when perform testing, it will write in the unique code such as MAC, SAS, UUID, WWID in server database, contain all of the above information 100% traceability, if the part or board miss the test in the tester, will be detect by next station.

- Control and transparency in the production
- Auto assign the unique identifier to product
- Identification, traceability including movement control
- Output information from ICT/FCT is collected and stored
- Recording output movements, quantities, test result from machine
- Information linked between Database and Production
